

Programming in Python (CSE 3142)

MINOR ASSIGNMENT-4: DEBUGGING

1. Consider the following Python code intended to compute the sum of n natural numbers. During testing, it was found that sum printed by program always excludes the last number. Debug the following script using the debugger.

Program to compute the sum of n natural numbers

```
1 def summation(n):  
2     '''  
3     Objective: To find sum of first n positive integers  
4     Input Parameter: n – numeric value  
5     Return Value: total – numeric value  
6     '''  
7     total = 0  
8     for count in range(1,n):  
9         total += count  
10    return total  
11  
12 def main():  
13     '''  
14     Objective: To find sum of first n positive integers based  
15     on user input  
16     Input Parameter: None  
17     Return Value: None  
18     '''  
19     n = int(input("Enter number of terms: "))  
20     total = summation(n)  
21     print("Sum of first",n,"positive integers:",total)  
22  
23 if __name__ == '__main__':  
    main()
```

2. Consider the following Python code intended to print inverse right triangle for given numbers of rows nRows. For example, for nRows = 5, the following inverted triangle should be printed:

```
*****  
****  
***  
**  
*
```

During testing, it was found that the program does not produce even the single line of output. Debug the following script using the debugger.

Program to print inverse right triangle

```
1 def invertedRightTriangle(nRows):  
2     '''  
3     Objective: To print right triangle
```

```

4      Input Parameter: nRows – integer value
5      Return Value: None
6      '''
7      for i in range(nRows,0):
8          print(" "*i)
9
10     def main():
11         '''
12         Objective: To print right triangle
13         Input Parameter: None
14         Return Value: None
15         '''
16         nRows = int(input("Enter number of rows: "))
17         invertedRightTriangle(nRows)
18
19     if __name__ == '__main__':
20         main()

```

3. Consider the Python script given below intended to compute the percentage. During testing, it was found that percentage computed was not accurate rather rounded to lower bound integer value. Debug the following script using the debugger.
- Program to print inverse right triangle

```

1     def main():
2         '''
3         Objective: To display percentage of marks scored by the
4         student
5         Input Parameter: None
6         Return Value: None
7         '''
8         totalMarks = 0
9         i = 0
10        while True:
11            marks = input("Enter marks for subject "+str(i+1)+":")
12            if marks == '':
13                break
14            marks = int(marks)
15            if marks < 0 or marks > 100:
16                print("Invalid marks")
17                continue
18            i += 1
19            totalMarks += marks
20            percentage = totalMarks // i
21            print("Total marks",int(totalMarks))
22            print("Percentage",round(percentage,2))
23
24    if __name__ == '__main__':
25        main()

```

4. Consider the Python given below intended to determine whether the given year is a leap year. During testing, it was found that an year such as 1800 or 2100, despite being non-leap year, was also displayed as a leap-year. Debug the following script using the debugger.

Program to print inverse right triangle

```

1 def isLeapYear(year):
2     '''
3     Objective: To determine whether a given year is a leap
4     year or not
5     Input Paramter: year – numeric value
6     Return value: True if year us a leap year, False otherwise
7     '''
8     return year%400 == 0 or year%100 == 0 and year%4 == 0

```

5. Consider the Python script given below intended to find HCF. During testing, it was found that program yields an error for numbers having no common factor other than 1. Debug the following script using the debugger.

Program to print inverse right triangle

```

1 def findHCF(num1, num2):
2     '''
3     Objective: To find HCF of two numbers, num1 and num2,
4     Input Parameters: num1, num2 – numeric values
5     Return Value: HCF – numeric value
6     '''
7     if num1<num2:
8         minNum = num1
9     else:
10        minNum = num2
11    for i in range(minNum,1,-1):
12        if num1%i == 0 and num2%i == 0:
13            HCF = i
14    return HCF
15
16 def main():
17     '''
18     Objective: To take two numbers as an input and find their
19     HCF
20     Input Parameter: None
21     Return Value: None
22     '''
23    num1 = int(input("Enter first number: "))
24    num2 = int(input("Enter second number: "))
25    print(findHCF(num1, num2))
26
27 if __name__ == '__main__':
28     main()

```
